

A **document-driven** assistant, not a compiled app: **Knowledge/** is the single source of truth · **Skills/** is the execution workflow · **Python validators** are the deterministic gates. **The model proposes; the validators dispose.**

KNOWLEDGE/ — SINGLE SOURCE OF TRUTH

The "what & why". Each concept has exactly one owning document.

MASTER_CONTEXT	Orchestrator — document map, ownership matrix, precedence & consult order. Read first.
SYSTEM_INSTRUCT.	Identity, principles & guardrails (never invent, never leak PII, human review mandatory).
USER_REQ_PATTERNS	Intent detection → routes the request to the right capability.
QA_METHODODOLOGY	Test-design method: decomposition, coverage, boundaries, priority (ANALYZE + PLAN).
TEST_CASE_GEN.	Authoring standard: titles, steps, expected results, TC-ID format (DESIGN).
VALIDATION_ENGINE	All validation rules + self-correction loop (VALIDATE).
EXCEL_SPEC.	Output contract: sheets, 8 columns, merge rules, naming, schema:2.5 stamp.
DATA_HANDLING	Data classification, PII/secret minimisation, cloud-LLM data-flow statement.
CONGA_DOMAIN_REF.	Conga CPQ/CLM terminology — objects, lifecycle, actions for concrete wording.
AI_CAPABILITIES	Capability catalog + maturity (TestCaseAuthoring = Production; others Planned).
EXAMPLES	Teach-by-example corpus; good-vs-poor contrasts (quality guidance only).
ARCHITECTURE / README	Architectural & orientation context (illustrative — not the deployed system).

SKILLS/ — EXECUTION LAYER

The "how it runs" — workflow state machine + operational state.

_base/workflow.base	Shared workflow: generic states, retries, error recovery, checkpoints, versioning.
TCA/skill.md	Skill contract — responsibility, supported inputs, deliverables, boundaries.
TCA/workflow.md	Domain states ANALYZE → PLAN → DESIGN, inserted into the base workflow.
TCA/examples.md	End-to-end execution examples of how a run behaves.
project_registry.json	Known project keys / business units for ID namespacing.
id_ledger.json	Persistent record of every issued TC-ID → global uniqueness across workbooks.
SKILLS_REGISTRY	Manifest of skills + "how to add one"; records deprioritised ideas.
_template/	Skeleton to scaffold a new skill by inheritance without touching the base.
ENFORCEMENT — DETERMINISTIC GATES Code, not opinion. Exit non-zero ⇒ output is not delivered.	
validate_workbook.py	Machine authority for the output contract: schema, IDs (NS-01/02), coverage (CV-06..11).
apply_merged_layout.py	Standard presentation — merges TC-level cells & right-sizes rows.
build_coverage_ledger.py	Emits the per-workbook coverage.json sidecar the validator checks.
lint_docs.py	Doc linter — blocks stale schema stamps, bare IDs, broken cross-refs.

ROOT & OUTPUTS

Entry point, project context & delivered artifacts.

PROJECT_INSTRUCT.	Runtime entry point — mandates using Skills/TestCaseAuthoring docs, never a registered skill.
README.md	Top-level overview: what the agent is, the gates, repo layout, honest status.
STATE_OF_THE_SYSTEM	Current living state-of-the-system assessment (supersedes archived reviews).
Flow_and_Files.md	The architect's flow & file guide this chart is based on.
archive/*	Superseded architecture-review snapshots kept for history.
Generated_TestCases/*	Delivered outputs — one .xlsx + one .coverage.json per run (Epics 04–12, samples).
TRUST MODEL — WHY OUTPUT IS SAFE Three gates + two human checkpoints; no path dead-ends.	
SELF_REVIEW	Cheap LLM pass — catches obvious gaps before the blocking gate.
VALIDATE	QA rulebook — 100% AC coverage, scenario balance, traceability, measurable results.
validate_workbook.py	Deterministic code gate — structure, IDs, coverage ledger. Blocks delivery on fail.
CP-1 / CP-2	Human checkpoints — ambiguous ask, or missing/contradictory source: ask, don't guess.

Workflow stage Quality gate Human checkpoint (CP) Knowledge Skills Enforcement
